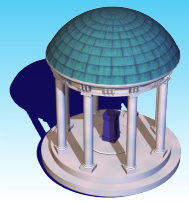
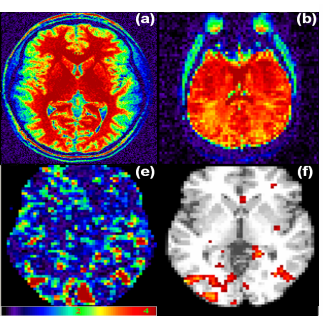
Candidate Gene	Geneticist		
Genome-wide SNP	Geneticist		
Genome-wide Gene	Geneticist		

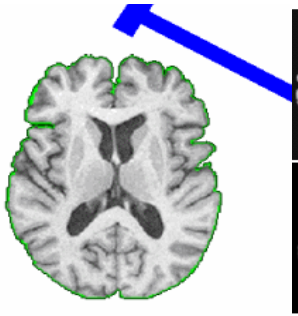


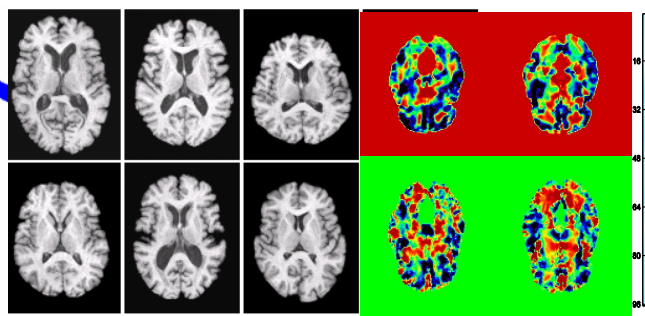
Noisy Imaging Data

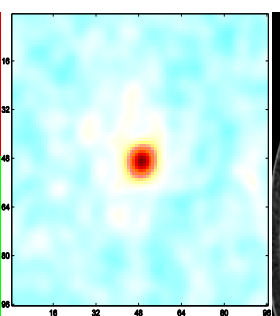
Key Features

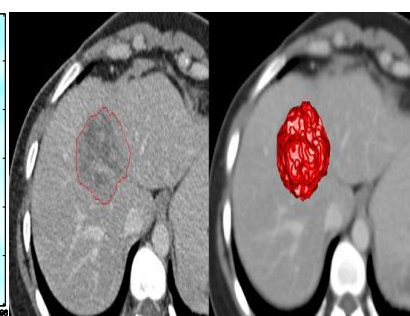
- Infinite Dimension
- Spatial Smoothness
- Spatial Correlation
- Spatial Heterogeneity

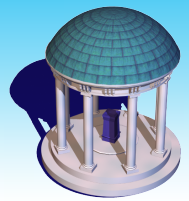












Infinite Dimensional Image

Mathematics.

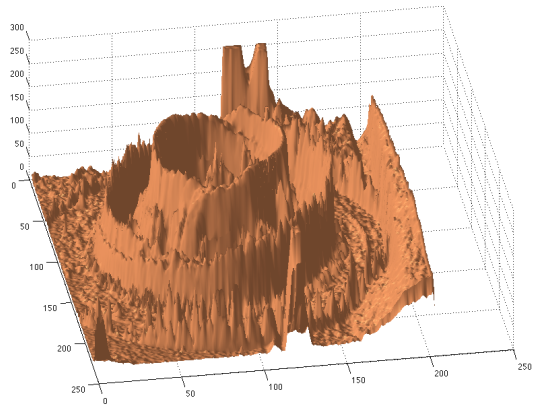


Image is the point or set of points in the range corresponding to a designated point in the domain of a given function.

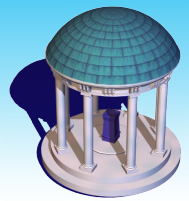
- Ω is a compact set. $\tilde{x} \in \Omega \subseteq R^k$

$$\Rightarrow \quad f(\tilde{x}) \in M \subseteq R^m \qquad f : \Omega \rightarrow M \subseteq R^m$$

$$\bigstar \quad \int_{\Omega} \| f(\tilde{x}) \|^k \, d\tilde{x} < \infty \quad \text{for some } k>0$$



Spatial Smoothness

Cartoon Model

$\theta(d) \in R^K$ $\theta_k(d)$

- **Disjoint Partition** $D = \cup_{l=1}^{L} D_l$ and $D_l \cap D_{l'} = \phi$
- **Piecewise Smoothness: Lipschitz condition**
- **Smoothed Boundary**
- **Local Patch**
- **Degree of Jumps**

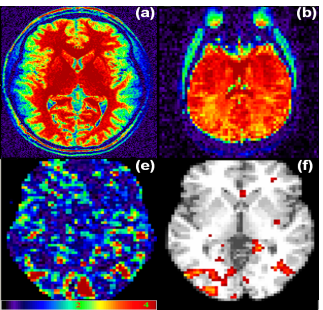
Estimation

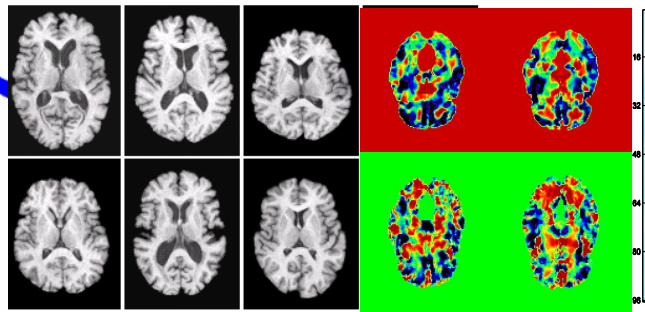
Prediction

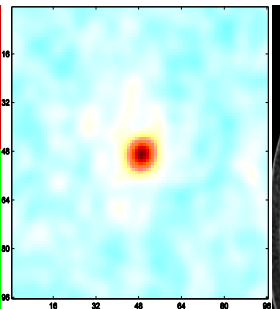
Smoothing

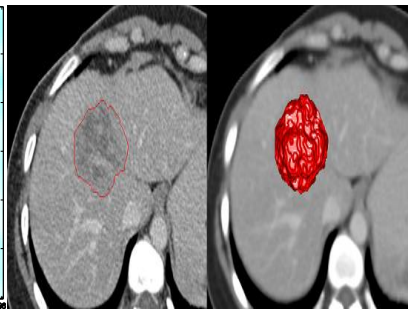
Voxel-wise Statistical Models

Multiple Comparisons



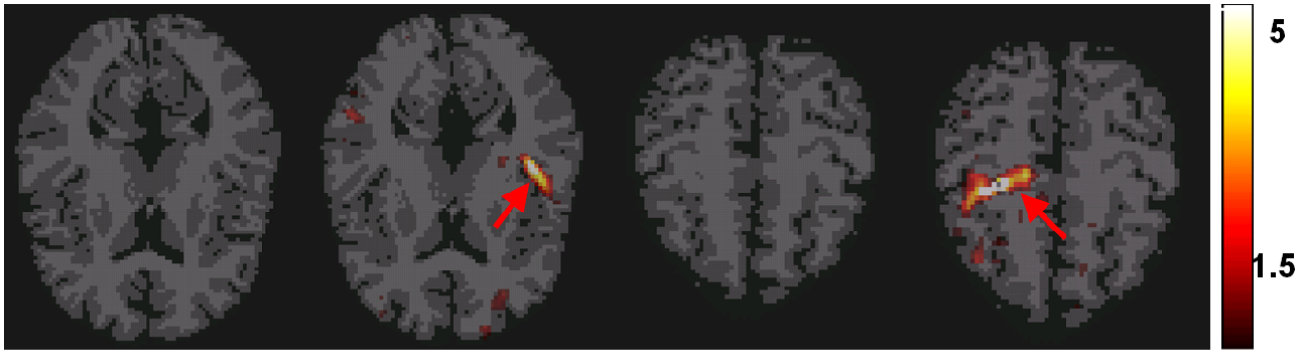




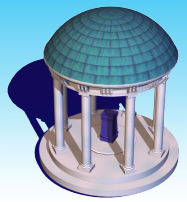


Smoothing Effect

- Smoothing method is independent of data
- Degree of smoothness is arbitrary
- Effect of smoothness is profound
- The relationship between smoothing method and study design is unknown



Jones et al. (2006),
Yue et al. (2010)



Prediction Accuracy: ADNI PET Data

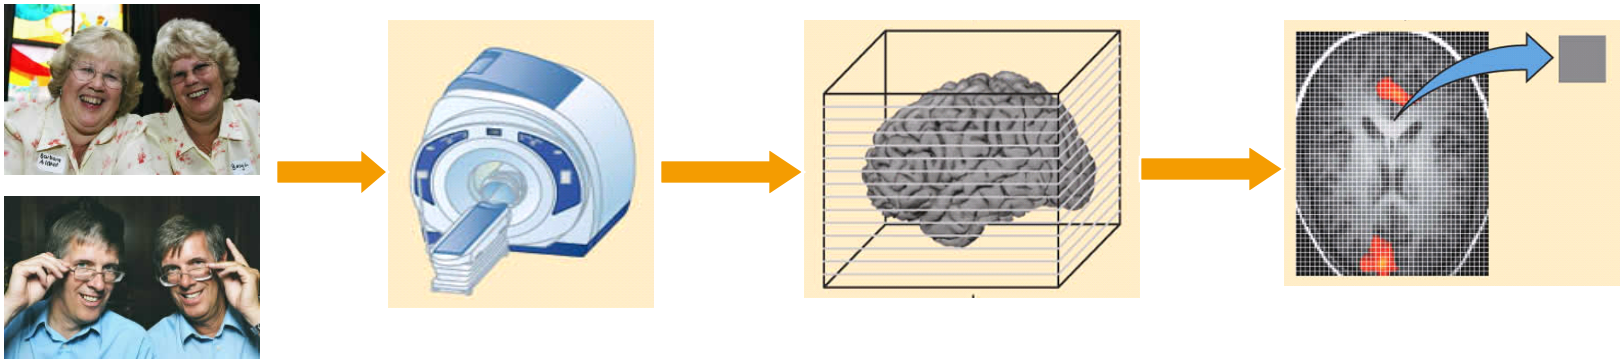
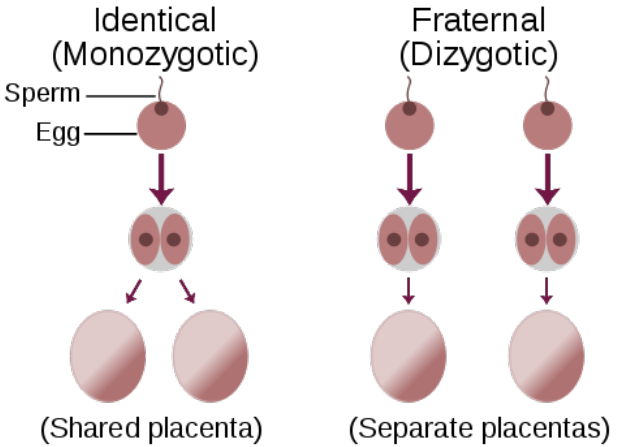
Twin Neuroimaging Data





MZ twins share same genetic material

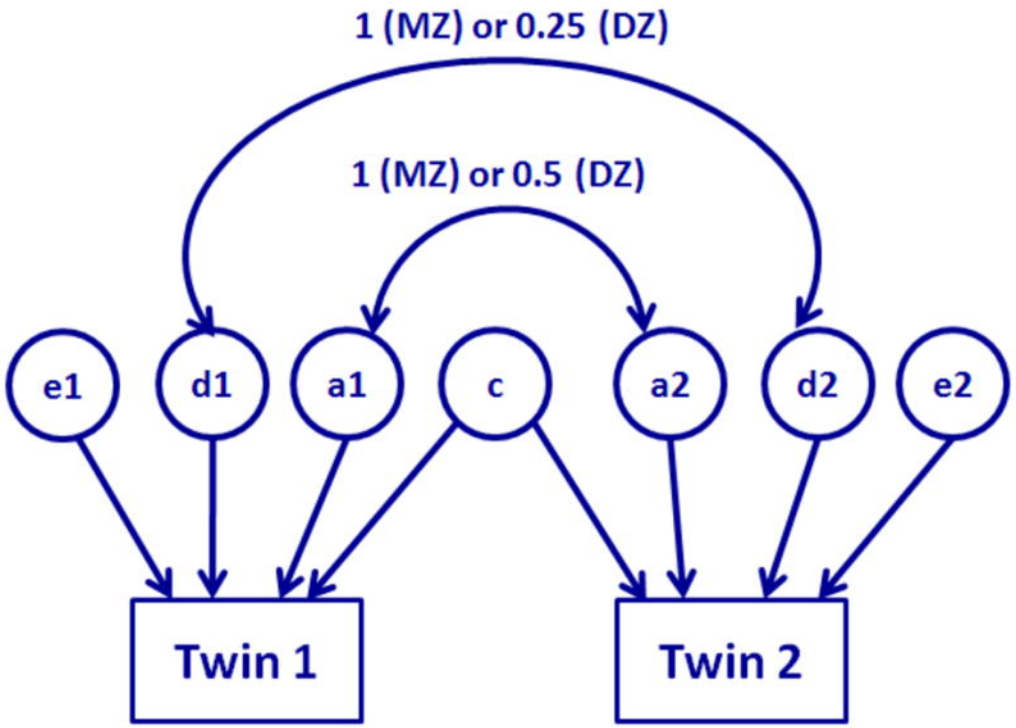
DZ twins share average 50% of their genes

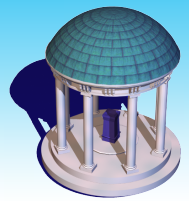
FSEM (I)

$$y_{ij}(d) = x_{ij}^T \beta(d) + a_{ij}(d) + d_{ij}(d) + c_i(d) + e_{ij}(d)$$

Additive and Dominance Genetic

Common Environmental





Two Strategies

Data $\{(Y_i, x_i) : i = 1, \cdots, n\}$ $Y_i = \{Y_i(d) : d \in D\}$

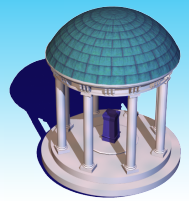
Strategy 1: Individual Approach

$$Y_i = \{Y_i(d) : d \in D\} \xrightarrow{W_i(.)} Y_{wi} = \{Y_{wi}(d) : d \in D\} = W_i(Y_i)$$

$$\prod_i p(Y_i \mid \theta = \{\theta(d) : d \in D\}) \qquad \prod_i p(Y_{wi} \mid \theta = \{\theta(d) : d \in D\})$$

Strategy 2: Global Approach

$$\prod_i p(Y_i \mid \theta = \{\theta(d) : d \in D\}) \xrightarrow{W(.)} W\left(\prod_i p(Y_i \mid \theta = \{\theta(d) : d \in D\})\right)$$



Hierarchical Smoothing Model

Strategy 1: Individual Approach (Hierarchical Smoothing Model)

- $Y_i \sim p(Y_i \mid \theta = \{\theta(d) : d \in D\})$

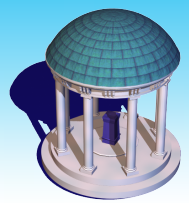
- $Y_i(d) = Y_{wi}(d) + \varepsilon_{wi}(d),$

  $\varepsilon_{wi} \sim p(\varepsilon_{wi} \mid 0, \sigma^2 = \{\sigma^2(d) : d \in D\})$

  $Y_{wi} \sim p(Y_{wi} \mid \tilde{\theta} = \{\tilde{\theta}(d) : d \in D\})$

Key Conditions:

- **Relative high SNR in individual image**
- **Consistency:** $\theta(d) = \tilde{\theta}(d) \text{ for } d \in D$



Problem 1: Smoothing

$$Y_i \sim p(Y_i \mid \theta = \{\theta(d) : d \in D\})$$

- **Parameters are not associated with the mean structure**

Twin Models

$$Y_i(d) = x_i^T \beta(d) + a_i(d) + c_i(d) + e_i(d),$$

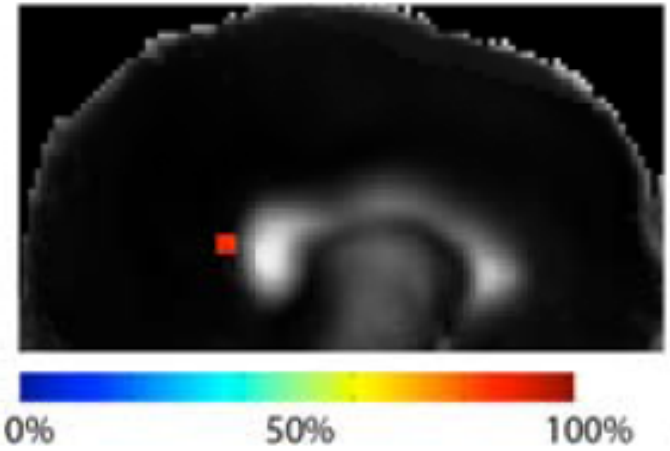
$$a_i(d) \sim (0, \sigma_a^2(d)),\ c_i(d) \sim (0, \sigma_c^2(d)),\ e_i(d) \sim (0, \sigma_e^2(d))$$

Consequence

Table 1. The effect of FA smoothing on the detection of FA-BDNF linkage

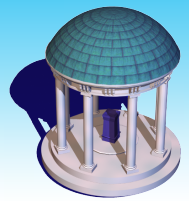
	FWHM (mm)				
	0	3	6	9	12
Number of FDR-significant voxels	142	68	44	0	0
FDR-significant clusters*	1(18), 2(9), 3(5), 4(4), 5(1), 10(1), 11(1), 13(1), 16(1), 20(1)	1(1), 2(1), 7(1), 58(1)	44(1)		

*Listed based on their size in voxels (the number of clusters of each size is in parentheses).



- **Moderate Smoothing: Single large cluster**
- **Excessive Smoothing: Effects disappeared**
- **No smooth: Small clusters**

Chiang et al. (2009)



Twin-MARM

There are two sets of parameters:
mean structure
variance structure

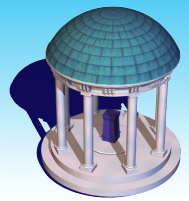
$$\{\beta(d) : d \in D\}$$

$$\{(\sigma_a^2(d), \sigma_c^2(d), \sigma_e^2(d)) : d \in D\}$$

Cartoon Model

Questions of interest:

- **Mean and variance images may have different patterns.**
- **Problematic Practice: Directly smooth imaging data**



Multiscale Adaptive Models

Strategy 2: Global Approach

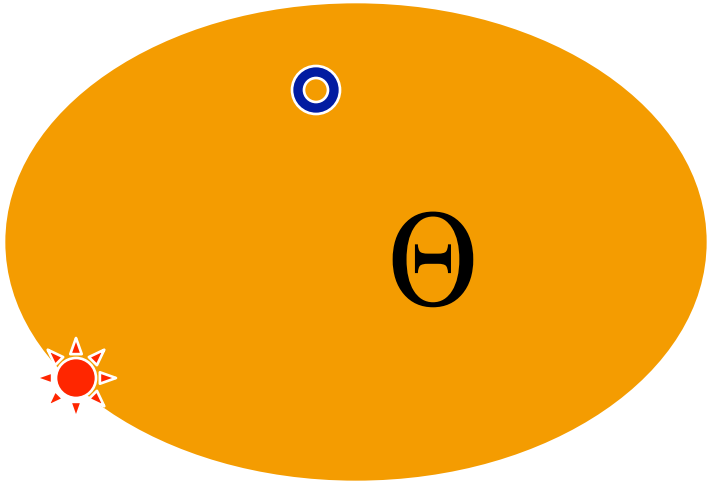
- $Y_i \sim \ell(\theta = \{\theta(d) : d \in D\} \mid Y_i)$

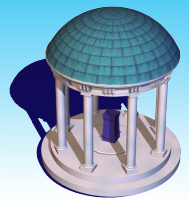
  $= \log p(Y_i \mid \theta = \{\theta(d) : d \in D\})$

- $W(\ell(\theta \mid Y_i))$

$\theta(d) \in \Theta$

Parametric Space





Twin-MARM

Two-stage Approach

- **Mean structure**

$$Y_{ij}(d) = x_{ij}^T \beta(d) + \varepsilon_{ij}(d) \Rightarrow \{\hat{\beta}(d;h) : d \in D\}$$

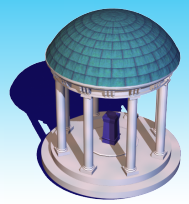
- **Variance structure**

$$\{Y_{ij}(d) - x_{ij}^T \hat{\beta}(d;h)\}^2 = z_{ij}^T \rho(d) + \delta_{ij}(d) \Rightarrow \{\hat{\rho}(d;h) : d \in D\}$$

Theorem 2: Substituting $\{\hat{\beta}(d;h) : d \in D\}$ into the second stage has negligible effect.

$$\omega_1(d,d';h) = K_{loc}(\| d - d' \|_2 / h) K_{st}(D_\beta(d,d';h)/C_n) \Rightarrow \{\hat{\beta}(d;h) : d \in D\}$$

$$\omega_2(d,d';h) = K_{loc}(\| d - d' \|_2 / h) K_{st}(D_\rho(d,d';h)/C_n) \Rightarrow \{\hat{\rho}(d;h) : d \in D\}$$



Simulation Study

ACE Model: $y_{ij}(v) = \mathbf{x}_{ij}^T \beta(v) + a_{ij}(v) + c_i(v) + e_{ij}(v)$

We set: $(\beta_2(v), \beta_3(v), \sigma_d(v)^2, \sigma_e(v)^2)^T = (1,1,1,1)^T$ across all voxels v

$(\beta_1(v), \sigma_a(v)^2)$ as $(0,0), (0.3,0.5), (0.6,1), (0.9,1.5)$ and $(1.2,2.0)$

across 5 regions of interest

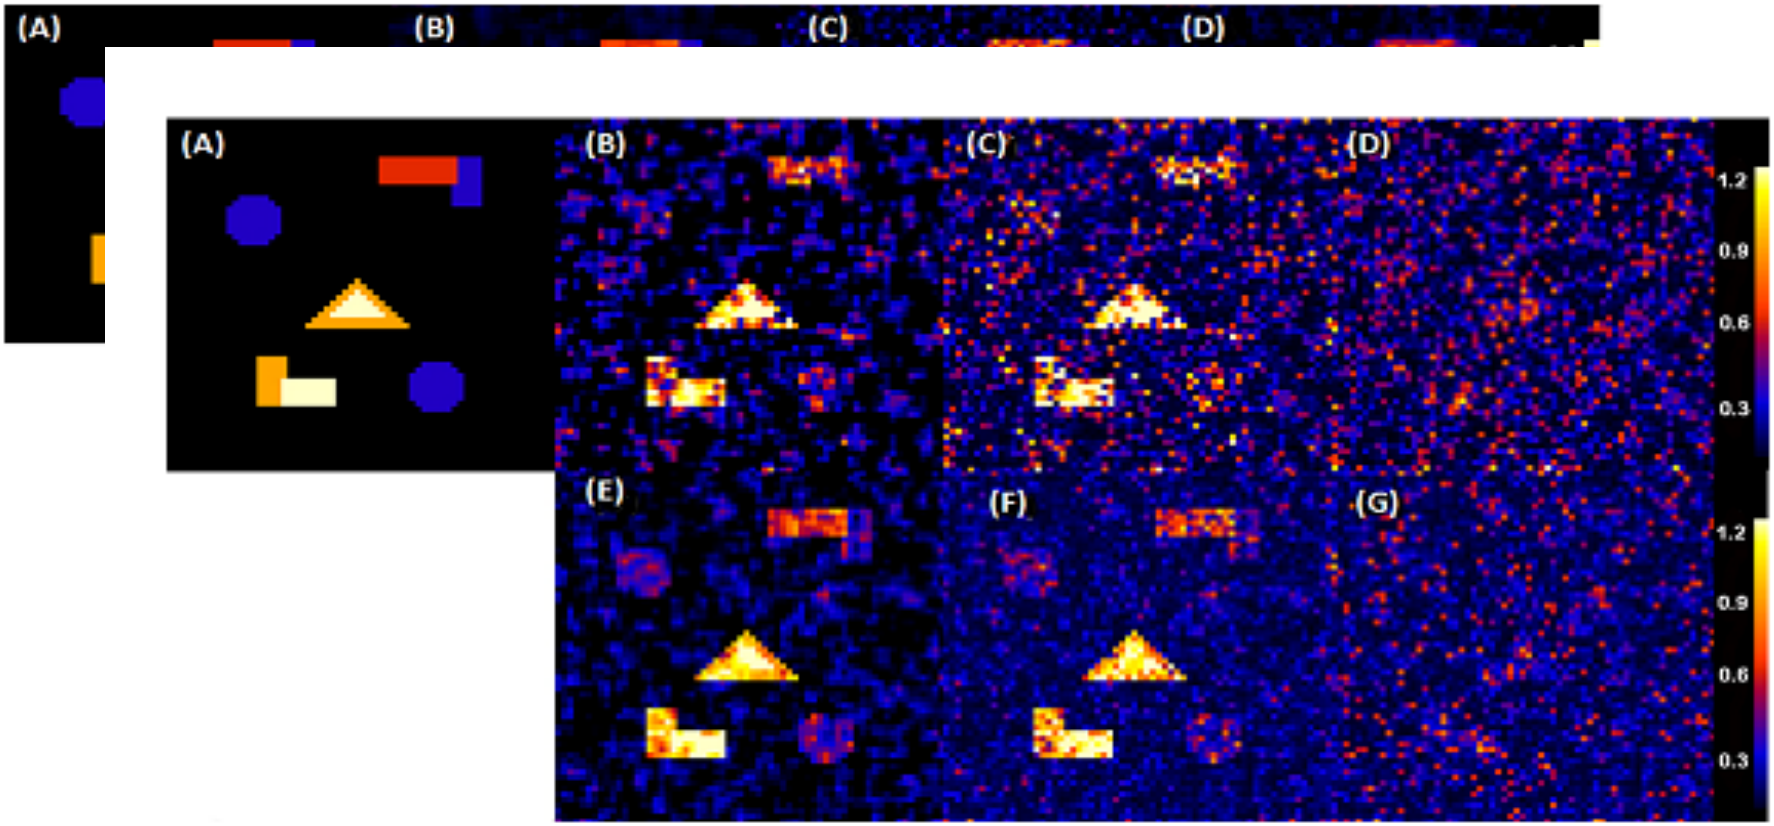
$a_{ij}(v)$, $d_{ij}(v)$, $c_i(v)$ and $e_{ij}(v)$ **: are independently normally distributed**

with mean 0 and variance: $\sigma_a(v)^2$, $\sigma_d(v)^2$, $\sigma_c(v)^2$, and $\sigma_e(v)^2$

$\mathrm{Cov}(a_{i1}(v), a_{i2}(v))$ **equals** $\sigma_a(v)^2$ **for MZ twins** $\sigma_a(v)^2/2$

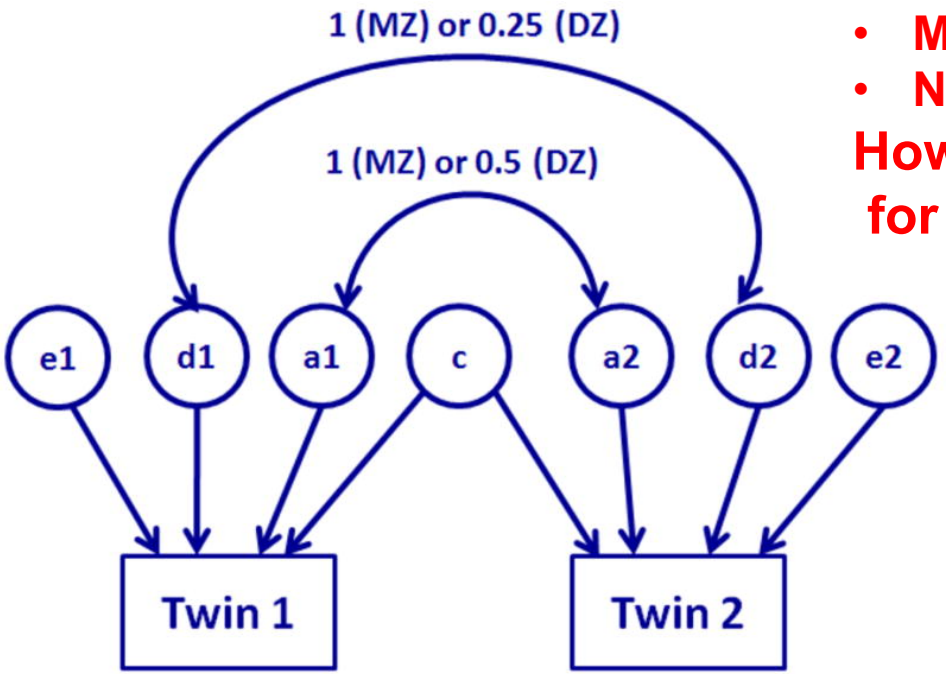
Simulation Study

It is dangerous to use Gaussian-kernel to smooth imaging data and then carry out twin analysis.



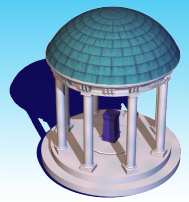
FSEM (I)

$$y_{ij}(d) = x_{ij}^T \beta(d) + a_{ij}(d) + d_{ij}(d) + c_i(d) + e_{ij}(d)$$



- **Marginal Modeling**
- **Not capture covariance structure**

How to define stochastic processes for DZ?



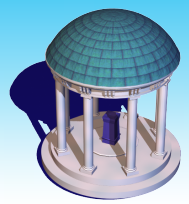
FSEM (II)

$$y_{ij}(d) = x_{ij}^T \beta(d) + \sqrt{0.5}1(\mathrm{DZ})a_{ij}(d) + [1(\mathrm{MZ}) + \sqrt{0.5}1(\mathrm{DZ})]a_i(d) + c_i(d) + e_{ij}(d)$$

$$a_{ij}(d) \sim GP(0, \Sigma_a)$$
$$a_i(d) \sim GP(0, \Sigma_a)$$
$$c_i(d) \sim GP(0, \Sigma_c)$$
$$e_{ij}(d) \sim GP(0, \Sigma_e)$$

$$\Sigma_Y(d,d') = \begin{bmatrix} \Sigma_a + \Sigma_c + \Sigma_e & \Sigma_a + \Sigma_c \\ \Sigma_a + \Sigma_c & \Sigma_a + \Sigma_c + \Sigma_e \end{bmatrix}(d,d')$$

$$\Sigma_Y(d,d') = \begin{bmatrix} \Sigma_a + \Sigma_c + \Sigma_e & 0.5\Sigma_a + \Sigma_c \\ 0.5\Sigma_a + \Sigma_c & \Sigma_a + \Sigma_c + \Sigma_e \end{bmatrix}(d,d')$$



FSEM (II)

Three-stage Approach

- **Mean structure**

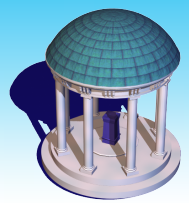
$$Y_{ij}(d) = x_{ij}^T \beta(d) + \varepsilon_{ij}(d) \Rightarrow \{\hat{\beta}(d;h) : d \in D\}$$

- **Variance structure (Weighted likelihood)**

$$\{Y_{ij}(d) - x_{ij}^T \hat{\beta}(d;h)\}^2 = z_{ij}^T \rho(d) + \delta_{ij}(d) \Rightarrow \{\hat{\rho}(d;h) : d \in D\}$$

- **Estimate covariance operators**

$$\Sigma_a(d,d') \text{ and } \Sigma_c(d,d')$$



FSEM (II)

Two Key Test Procedures

- **Test marginal genetic and environmental effects**

$$H_{0A}(d):\Sigma_a(d,d)=0 \text{ versus } H_{1A}(d):\Sigma_a(d,d)>0$$

$$H_{0C}(d):\Sigma_c(d,d)=0 \text{ versus } H_{1C}(d):\Sigma_c(d,d)>0$$

- **Test global genetic and environmental effects**

$$H_{0A}:\int\Sigma_a(d,d)m(d)=0 \text{ versus } H_{1A}(d):\int\Sigma_a(d,d)m(d)>0$$

$$H_{0C}:\int\Sigma_c(d,d)m(d)=0 \text{ versus } H_{1C}(d):\int\Sigma_c(d,d)m(d)>0$$

Simulations

UNC Early Brain Development Studies

PIs: Drs. John H. Gilmore and Weili Lin

To track changes in behavior with brain structure, connectivity, and function, in order to characterize the progression from primary changes to subsequent clinical presentation, and to identify predictors of divergence from the typical trajectory.

- Singletons, twins, high risk
- A longitudinal prospective study
- 900 young children aged 0 to 6 years
- Recruited prenatally
  - Exclusion: ultrasound abnormality, significant fetal/ maternal medical problem, substance abuse
- 3TMRI (Seimens Allegra)
  - T1, T2, DTI, resting state fMRI
- Scanned during normal sleep(no meds)
- Ear protection, head in vac-fix device
- Success rate: 87% @ 2 weeks, 71% @ 1 year, 62% at 2 years

Quantitative tract-based white matter heritability in twin neonates

- The data set consists of **356** healthy twin neonates with **190 males and 166 females** from the neonatal project as part of the UNC Early Brain Development Studies.
- There are **129** twin pairs (**48 MZ** twin pairs and **81 DZ** twin pairs) and **98 unrelated "singleton" twins** - a single unpaired twin subject in which a usable scan was not obtained from the co-twin.
- The gestational ages of these infants range from 257 to 401 days, and their mean gestational age is 289 days with standard deviation 18 days.

Question of interest:
comprehensive heritability data on white matter microstructure fractional anisotropy (FA), radial diffusion (RD), and axial diffusion (AD) along 47 fiber tracts.

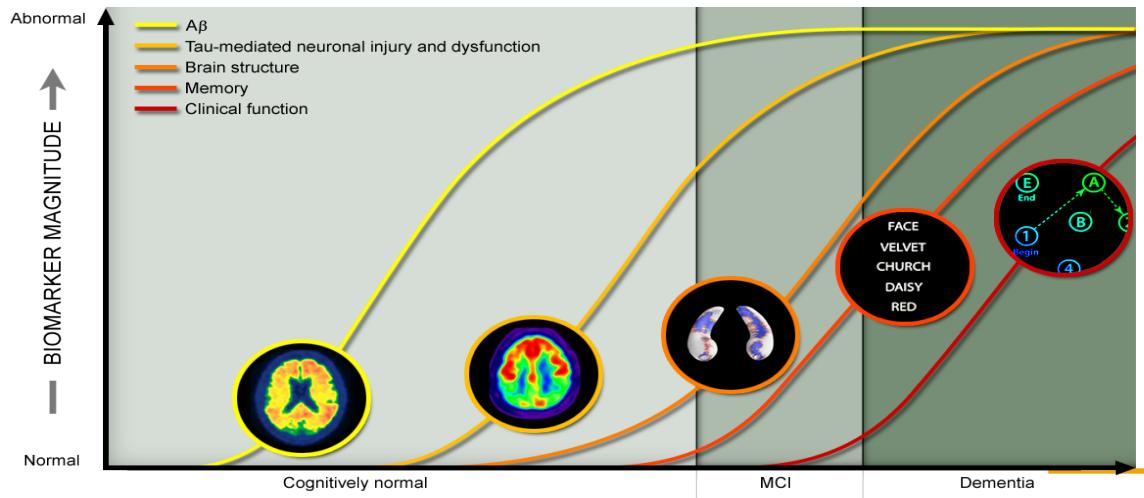
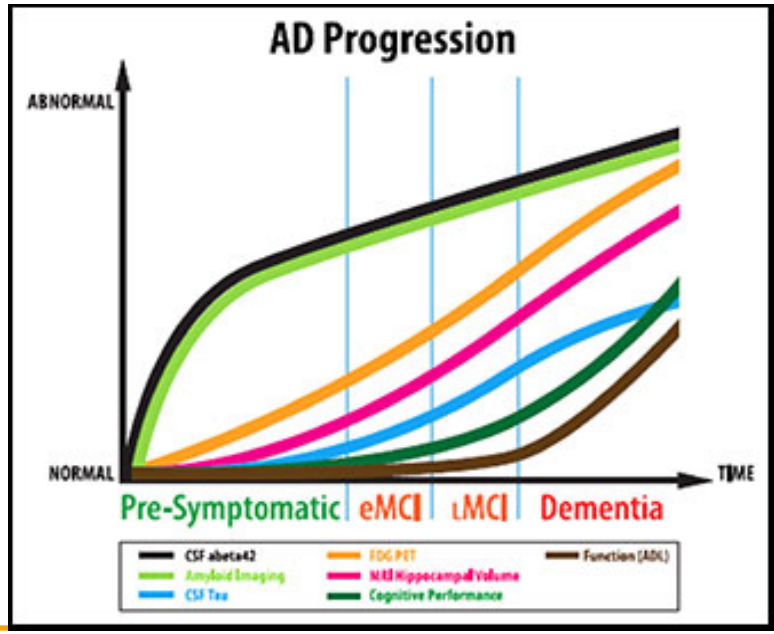
Imaging Genetics for ADNI

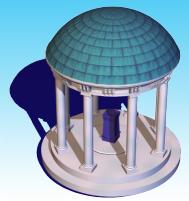
PI: Dr. Michael W. Weiner

- detecting AD at the earliest stage and marking its progress through biomarkers;
- developing new diagnostic methods for AD intervention, prevention, and treatment.

- A longitudinal prospective study with 1700 aged between 55 to 90 years
- Clinical Data including Clinical and Cognitive Assessments
- Genetic Data including Ilumina SNP genotyping and WGS
- MRI (fMRI, DTI, T1, T2)
- PET (PIB, Florbetapir PET and FDG-PET)
- Chemical Biomarker



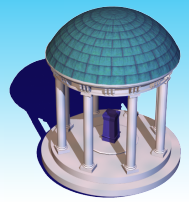




ADNI Data Analysis: Dataset Description

- 708 MRI scans of AD (186), MCI (388), and healthy controls (224) from ADNI-1.
- These scans on 462 males and 336 females are performed on a 1.5 T MRI scanners.
- The typical protocol includes the following parameters:
  (i) repetition time (TR) = 2400 ms;
  (ii) inversion time (TI) = 1000 ms;
  (iii) flip angle = 8^{o};
  (iv) field of view (FOV) = 24 cm with a 256 x 256 x 170 acquisition matrix in the x−, y−, and z−dimensions,
  (v) voxel size: 1.25 x 1.26 x 1.2 mm^{3}.

- Covariates: gender, age, APOE ε4, and the top 5 PC scores in SNPs



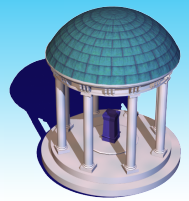
Imaging Data Preprocessing

Surface fluid registration based hippocampal sub-regional analysis package (Shi et al., Neuroimage, 2013)

- **Hippocampal surface registration**
  isothermal coordinates and fluid registration

- **Surface statistics computation**
  1. **multivariate tensor-based morphometry (mTBM) statistics**
  2. **radial distance**

Finally, we obtained left and right hippocampus shape representations as 100×150 matrices.



Our computational time
About 92,000 s

ADNI Data Analysis

Top 10 SNPs (Left Hippocampus)

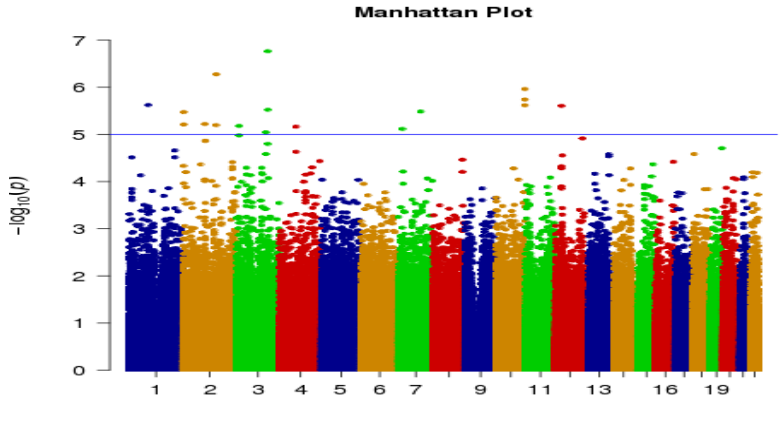
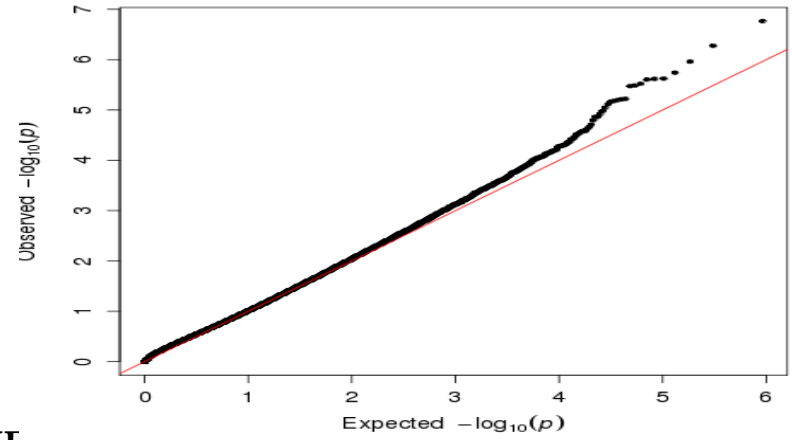
(Right Hippocampus)





ADNI Data Analysis: Left Hippocampus

(Left Hippocampus)

Top 1 SNP: rs657132
Closed Gene: HRH4

HRH4 (Histamine Receptor H4) is a Protein Coding gene.
Diseases associated with HRH4: cerebellar degeneration
An important paralog of this gene: CHRM4

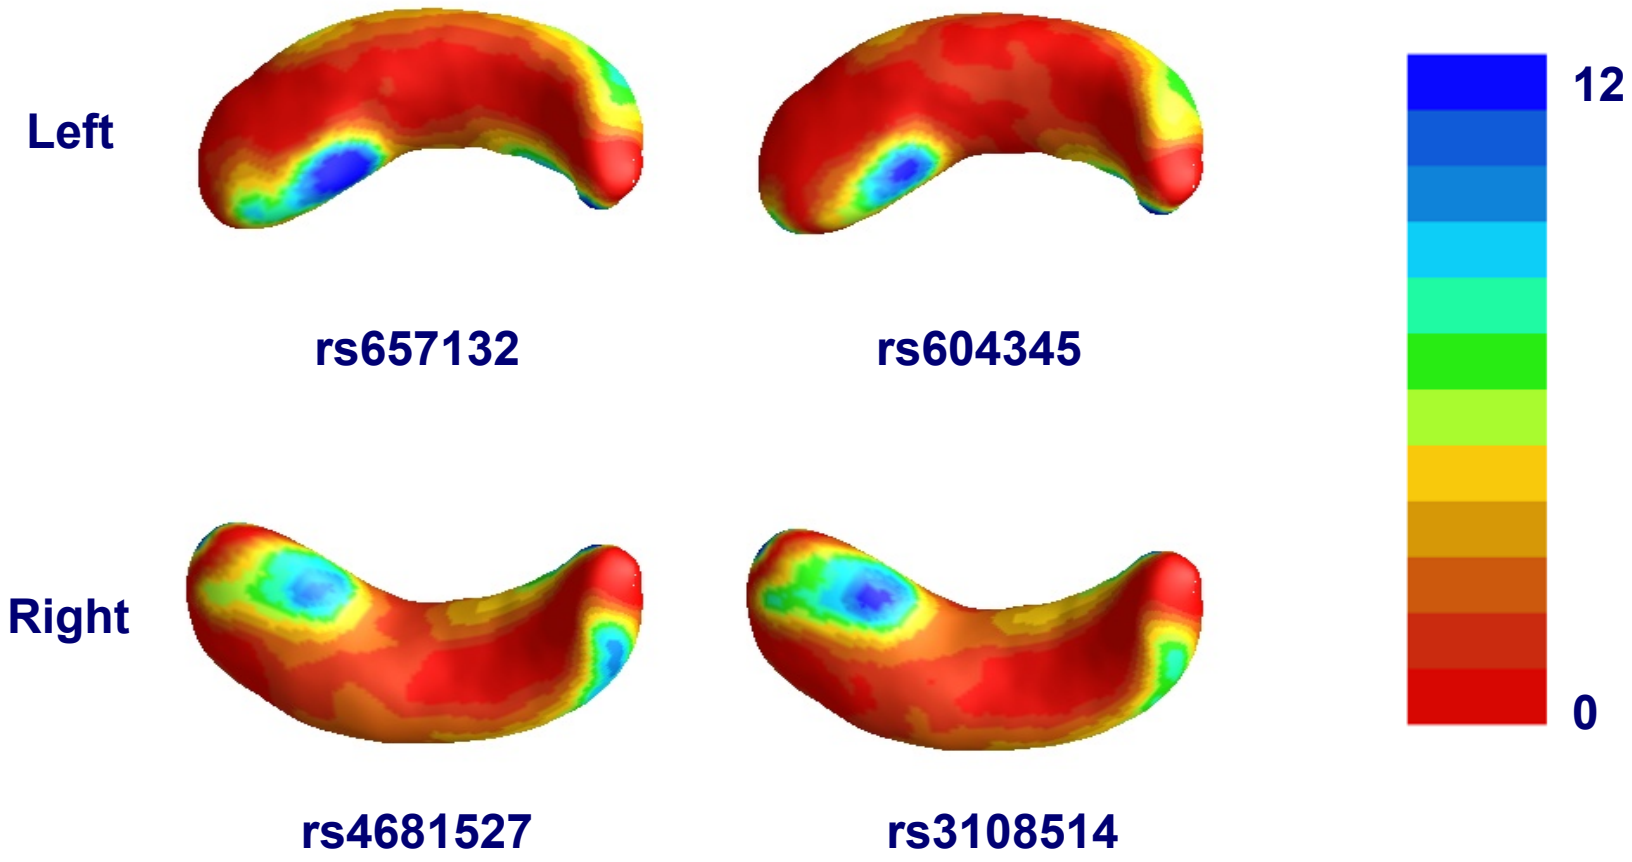
Mirshafiey & Naddafi, Am J Alzheimers Dis Other Demen. 2013

(Right Hippocampus)

Top 1 SNP: rs4681527
Closed Gene: C3orf58

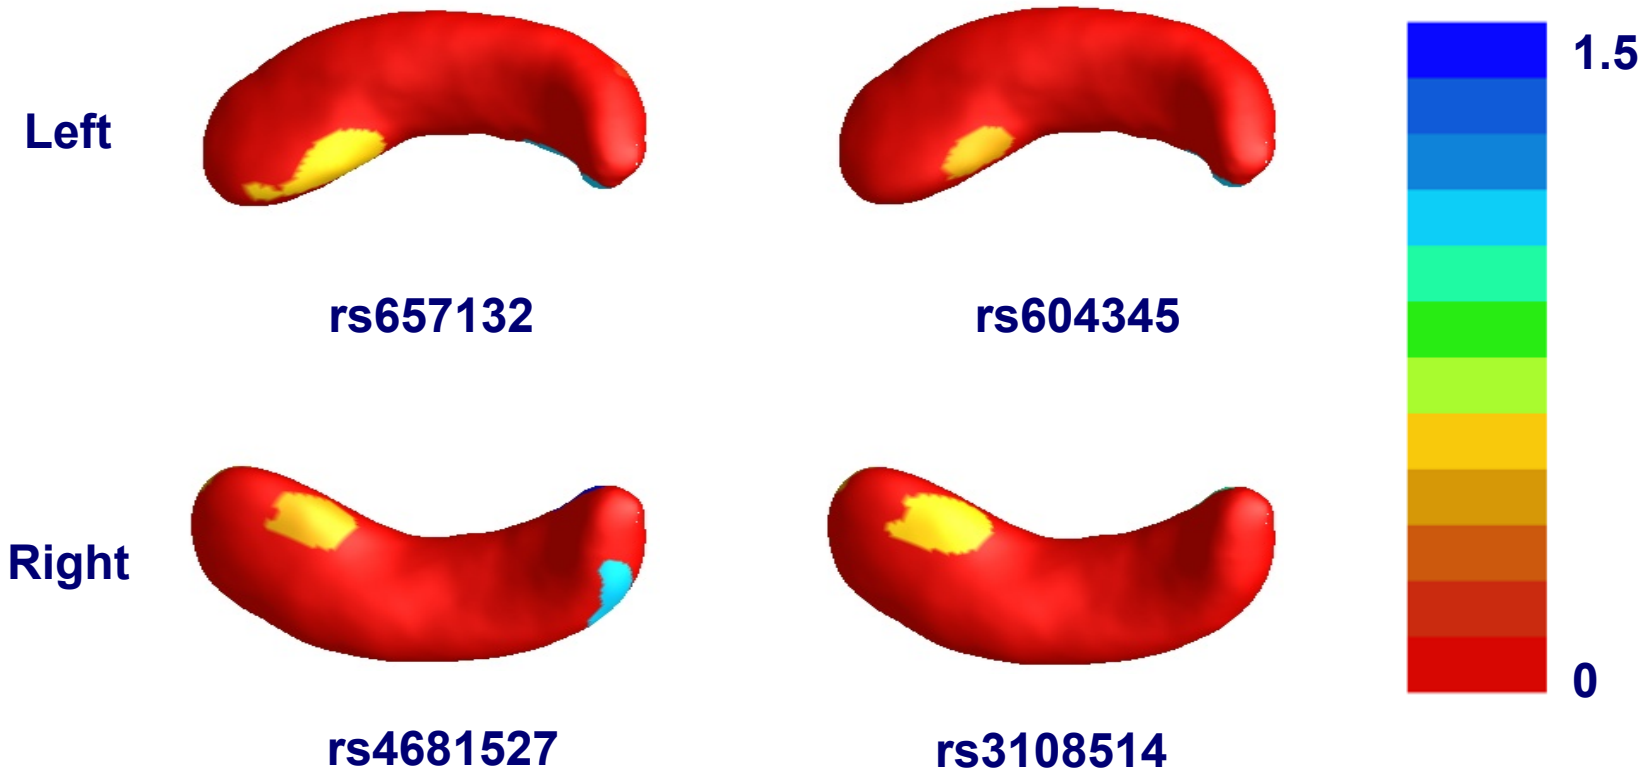
C3orf58 (Chromosome 3 Open Reading Frame 58) is a Protein Coding gene.
Diseases associated with C3orf58: hypoxia

ADNI Data Analysis



$-\log_{10}(p)$ values on Hippocampus (L & R) corresponding to Top 2 SNPs

ADNI Data Analysis



$-\log_{10}(p)$ values of significant clusters on Hippocampus (L & R) corresponding to Top 2 SNPs
