Web Appendix A. Proofs

**Proof of Proposition 1.** Since \((F_1, F_2, U)\) and \((\tilde{F}_1, \tilde{F}_2, \tilde{U})\) are both mutually uncorrelated, we have

\[
\text{cov}(\Lambda_1 F_1, \Lambda_2 F_2) = 0, \quad \text{cov}(\Lambda_1 F_1, U) = 0, \quad \text{cov}(\Lambda_2 F_2, U) = 0,
\]

\[
\text{cov}(\tilde{\Lambda}_1 \tilde{F}_1, \tilde{\Lambda}_2 \tilde{F}_2) = 0, \quad \text{cov}(\tilde{\Lambda}_1 \tilde{F}_1, \tilde{U}) = 0, \quad \text{cov}(\tilde{\Lambda}_2 \tilde{F}_2, \tilde{U}) = 0.
\]

Suppose \(\Lambda_g F_g + U = \tilde{\Lambda}_g \tilde{F}_g + \tilde{U}\) for \(g \in \{1, 2\}\). Let \(W = \tilde{U} - U\). Then, \(\tilde{\Lambda}_1 \tilde{F}_1 = \Lambda_1 F_1 - W\) and \(\tilde{\Lambda}_2 \tilde{F}_2 = \Lambda_2 F_2 - W\). We have

\[
0 = \text{cov}(\tilde{\Lambda}_1 \tilde{F}_1, \tilde{\Lambda}_2 \tilde{F}_2) = \text{cov}(\Lambda_1 F_1 - W, \Lambda_2 F_2 - W)
= \text{cov}(\Lambda_1 F_1, \Lambda_2 F_2) + \text{Var}(W) - \text{cov}(\Lambda_1 F_1, W) - \text{cov}(\Lambda_2 F_2, W).
\]

It implies that

\[
\text{Var}(W) = \text{cov}(\Lambda_1 F_1, W) + \text{cov}(\Lambda_2 F_2, W). \quad (S1)
\]

Similarly, we have

\[
0 = \text{cov}(\tilde{\Lambda}_g \tilde{F}_g, \tilde{U}) = \text{cov}(\Lambda_g F_g - W, U + W)
= \text{cov}(\Lambda_g F_g, U) - \text{Var}(W) + \text{cov}(\Lambda_g F_g, W) - \text{cov}(U, W).
\]

Then,

\[
\text{Var}(W) = -\text{cov}(U, W) + \text{cov}(\Lambda_g F_g, W). \quad (S2)
\]

By (S2), we also have

\[
\text{cov}(\Lambda_1 F_1, W) = \text{cov}(\Lambda_2 F_2, W). \quad (S3)
\]

By (S1) and (S3), we have \(\text{Var}(W) = 2\text{cov}(\Lambda_1 F_1, W) = 2\text{cov}(\Lambda_2 F_2, W)\). By (S1) and (S2), we have \(-\text{cov}(U, W) = \text{cov}(\Lambda_1 F_1, W) = \text{cov}(\Lambda_2 F_2, W)\). Then, we have

\[
\text{Var}(W) = -2\text{cov}(U, W) = 2\text{cov}(\Lambda_1 F_1, W) = 2\text{cov}(\Lambda_2 F_2, W).
\]
Therefore,
\[
\tilde{\Lambda}_g \tilde{\Lambda}_g' = \text{Var}(\tilde{\Lambda}_g \tilde{F}_g) = \text{Var}(\Lambda_g F_g - W) = \text{Var}(\Lambda_g F_g) + \text{Var}(W) - 2\text{cov}(\Lambda_g F_g, W)
\]
\[
= \text{Var}(\Lambda_g F_g) = \Lambda_g \Lambda'_g.
\]
Thus, \(\text{Var}(\tilde{U}) = \text{Var}(U + W) = \text{Var}(U) + \text{Var}(W) + 2\text{cov}(U, W) = \text{Var}(U).\)

**Proof of Theorem 2.**

(a) By definition,
\[
\tau_{jk} = E(\tilde{\tau}_{jk}) = E\left[\frac{2}{n(n-1)} \sum_{1 \leq i < i' \leq n} \text{sign}\{ (X_{ij} - X_{i'j})(X_{ik} - X_{i'k}) \} \right].
\]
For the simplicity of notation, we omit \(i\) and \(i'\) from the subscripts and write \(X_{ij}\) and \(X_{i'j}\) as \(X_j\) and \(X'_j\), where we treat them as two independent realizations from the same distribution.

Since \(X_j\) and \(X'_j\) are three-level ordinal variables,
\[
\text{sign}(X_j - X'_j) = I(X_j = 2, X'_j = 0) + I(X_j = 2, X'_j = 1) + I(X_j = 1, X'_j = 0)
\]
\[\quad - I(X_j = 1, X'_j = 2) - I(X_j = 0, X'_j = 1) - I(X_j = 0, X'_j = 2)
\]
\[= I(X_j = 2) - I(X_j = 2, X'_j = 2)
\]
\[+ I(X_j = 1, X'_j = 0) - I(X_j = 0, X'_j = 1) - I(X'_j = 2) + I(X_j = 2, X'_j = 2)
\]
\[= I(X_j = 2) - I(X'_j = 2) + I(X_j = 1, X'_j = 0) - I(X_j = 0, X'_j = 1).
\]
Define \(Z = f(Y)\), where \(Z \sim N(0, \Sigma)\). Since \(\text{sign}(x) = 2I(x > 0) - 1\), we have
\[
\tau_{jk} = E\left\{ \text{sign}(X_j - X'_j) \text{sign}(X_k - X'_k) \right\} = E\left[ \text{sign}(X_j - X'_j)\{2I(X_k > X'_k) - 1\} \right]
\]
\[= E\left\{ 2\text{sign}(X_j - X'_j)I(X_k > X'_k) - \text{sign}(X_j - X'_j) \right\}
\]
\[= E\left\{ 2I(X_j = 2)I(X_k > X'_k) - 2I(X'_j = 2)I(X_k > X'_k)
\]
\[+ 2I(X_j = 1, X'_j = 0)I(X_k > X'_k) - 2I(X_j = 0, X'_j = 1)I(X_k > X'_k) \right\}.
\]
\[- I(X_j = 2) + I(X_j' = 2) - I(X_j = 1, X_j' = 0) + I(X_j = 0, X_j' = 1) \}\n\[= \mathbb{E} \left\{ 2I(Z_j > \Delta_{j2}, Z_k - Z_k' > 0) - 2I(Z_j' > \Delta_{j2}, Z_k - Z_k' > 0) \right\} \]
\[+ 2I(\Delta_{j1} < Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}, Z_k - Z_k' > 0) \]
\[- 2I(Z_j < \Delta_{j1}, \Delta_{j1} < Z_j' < \Delta_{j2}, Z_k - Z_k' > 0) \]
\[- I(Z_j > \Delta_{j2}) + I(Z_j' > \Delta_{j2}) \]
\[- I(\Delta_{j1} < Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}) + I(Z_j < \Delta_{j1}, \Delta_{j1} < Z_j' < \Delta_{j2}) \}\n\[= 2\mathbb{P}(Z_j > \Delta_{j2}, Z_k - Z_k' > 0) - 2\mathbb{P}(Z_j' > \Delta_{j2}, Z_k - Z_k' > 0) \]
\[+ 2\mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}, Z_k - Z_k' > 0) \]
\[- 2\mathbb{P}(Z_j < \Delta_{j1}, \Delta_{j1} < Z_j' < \Delta_{j2}, Z_k - Z_k' > 0) \]
\[- \mathbb{P}(Z_j > \Delta_{j2}) + \mathbb{P}(Z_j' > \Delta_{j2}) \]
\[- \mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}) + \mathbb{P}(Z_j < \Delta_{j1}, \Delta_{j1} < Z_j' < \Delta_{j2}) \]
\[= 2\mathbb{P}(Z_k' - Z_k < 0) - 2\mathbb{P}(Z_j < \Delta_{j2}, Z_k' - Z_k < 0) \]
\[- 2\mathbb{P}(Z_k' - Z_k < 0) + 2\mathbb{P}(Z_j' < \Delta_{j2}, Z_k' - Z_k < 0) \]
\[+ 2\mathbb{P}(Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}, Z_k' - Z_k < 0) - 2\mathbb{P}(Z_j < \Delta_{j1}, Z_j' < \Delta_{j1}, Z_k' - Z_k < 0) \]
\[- 2\mathbb{P}(Z_j < \Delta_{j1}, Z_j' < \Delta_{j2}, Z_k' - Z_k < 0) + 2\mathbb{P}(Z_j < \Delta_{j1}, Z_j' < \Delta_{j1}, Z_k' - Z_k < 0) \]
\[= - 2\mathbb{P}(Z_j < \Delta_{j2}, Z_k' - Z_k < 0) + 2\mathbb{P}(Z_j' < \Delta_{j2}, Z_k' - Z_k < 0) \]
\[+ 2\mathbb{P}(Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}, Z_k' - Z_k < 0) - 2\mathbb{P}(Z_j < \Delta_{j1}, Z_j' < \Delta_{j2}, Z_k' - Z_k < 0) \]
\[= 2\Phi_2(\Delta_{j2}, 0; \frac{R_{jk}}{\sqrt{2}}) - 2\Phi_2(\Delta_{j2}, 0; -\frac{R_{jk}}{\sqrt{2}}) - 2\Phi_3(\Delta_{j1}, \Delta_{j2}, 0; \mathbf{R}_{3d}) + 2\Phi_3(\Delta_{j2}, \Delta_{j1}, 0; \mathbf{R}_{3d}). \]

(b) Since \( X_k \) and \( X_k' \) are binary variables,

\[
\text{sign}(X_k - X_k') = I(Y_k > C_k) - I(Y_k' > C_k). 
\]
We have

\[
\tau_{jk} = \mathbb{E} \left[ \text{sign}(X_j - X'_j) \left\{ I(Y_k > C_k) - I(Y'_k > C_k) \right\} \right]
\]

\[
= \mathbb{E} \left\{ I(X_j = 2, Y_k > C_k) - I(X'_j = 2, Y_k > C_k) + I(X_j = 1, X'_j = 0, Y_k > C_k) \right. \\
- I(X_j = 0, X'_j = 1, Y_k > C_k) - I(X_j = 2, Y'_k > C_k) + I(X'_j = 2, Y'_k > C_k) \\
- I(X_j = 1, X'_j = 0, Y'_k > C_k) + I(X_j = 0, X'_j = 1, Y'_k > C_k) \right\}
\]

\[
= \mathbb{E} \left\{ I(Y_j > C_{j2}, Y_k > C_k) - I(Y'_j > C_{j2}, Y_k > C_k) + I(C_{j1} < Y_j < C_{j2}, Y'_j < C_{j1}, Y_k > C_k) \\
- I(Y_j < C_{j1}, C_{j1} < Y'_j < C_{j2}, Y_k > C_k) - I(Y_j > C_{j2}, Y'_k > C_k) + I(Y'_j > C_{j2}, Y'_k > C_k) \\
- I(C_{j1} < Y_j < C_{j2}, Y'_j > C_{j1}, Y'_k > C_k) + I(Y_j < C_{j1}, C_{j1} < Y'_j < C_{j2}, Y'_k > C_k) \right\}
\]

\[
= \mathbb{P}(Z_j > \Delta_{j2}, Z_k > \Delta_k) - \mathbb{P}(Z'_j > \Delta_{j2}, Z_k > \Delta_k) + \mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) \\
- \mathbb{P}(Z_j < \Delta_{j1}, \Delta_{j1} < Z'_j < \Delta_{j2}, Z_k > \Delta_k) - \mathbb{P}(Z_j > \Delta_{j2}, Z'_k > \Delta_k) + \mathbb{P}(Z'_j > \Delta_{j2}, Z'_k > \Delta_k) \\
- \mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z'_k > \Delta_k) + \mathbb{P}(Z_j < \Delta_{j1}, \Delta_{j1} < Z'_j < \Delta_{j2}, Z'_k > \Delta_k)
\]

\[
= \mathbb{P}(Z_k > \Delta_k) - \mathbb{P}(Z_j < \Delta_{j2}, Z_k > \Delta_k) - \mathbb{P}(Z_j > \Delta_{j2}, Z_k > \Delta_k) + \mathbb{P}(Z'_j < \Delta_{j2}, Z_k > \Delta_k)\]

\[
+ \mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) - \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) \\
- \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z_k > \Delta_k) + \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) \\
- \mathbb{P}(Z'_j > \Delta_k) + \mathbb{P}(Z_j < \Delta_{j2}, Z'_k > \Delta_k) + \mathbb{P}(Z'_j > \Delta_k) - \mathbb{P}(Z'_j < \Delta_{j2}, Z'_k > \Delta_k) \\
- \mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z'_k > \Delta_k) + \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z'_k > \Delta_k) \\
+ \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z'_k > \Delta_k) - \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z'_k > \Delta_k)
\]

\[-2\mathbb{P}(Z_j < \Delta_{j2}, Z_k > \Delta_k) + 2\mathbb{P}(Z'_j < \Delta_{j2}, Z_k > \Delta_k) \\
+ 2\mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) - 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k > \Delta_k) \\
- 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z_k > \Delta_k) + 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k > \Delta_k)
\]
\[
\begin{align*}
&= -2\mathbb{P}(Z_j < \Delta_{j2}) + 2\mathbb{P}(Z_j < \Delta_{j2}, Z_k < \Delta_k) + 2\mathbb{P}(Z'_j < \Delta_{j2}) - 2\mathbb{P}(Z'_j < \Delta_{j2}, Z_k < \Delta_k) \\
&\quad + 2\mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}) - 2\mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) \\
&\quad - 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}) + 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) \\
&\quad - 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}) + 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z_k < \Delta_k) \\
&\quad + 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}) - 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) \\
&= 2\mathbb{P}(Z_j < \Delta_{j2}, Z_k < \Delta_k) - 2\mathbb{P}(Z'_j < \Delta_{j2}, Z_k < \Delta_k) \\
&\quad - 2\mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) + 2\mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z_k < \Delta_k) \\
&= 2\{\mathbb{P}(Z_j < \Delta_{j2}, Z_k < \Delta_k) - \mathbb{P}(Z'_j < \Delta_{j2})\mathbb{P}(Z_k < \Delta_k) \\
&\quad - \mathbb{P}(Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) + \mathbb{P}(Z_j < \Delta_{j1}, Z'_j < \Delta_{j2}, Z_k < \Delta_k)\} \\
&= 2\Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) - 2\Phi_1(\Delta_{j2})\Phi_1(\Delta_k) - 2\Phi_1(\Delta_{j1})\Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) + 2\Phi_1(\Delta_{j2})\Phi_2(\Delta_{j1}, \Delta_k; R_{jk}).
\end{align*}
\]

(c) Since \(X_j\) and \(X'_j\) are three-level ordinal variables,
\[
\text{sign}(X_j - X'_j) = I(X_j = 2) - I(X'_j = 2) + I(X_j = 1, X'_j = 0) - I(X_j = 0, X'_j = 1).
\]

Since \(X_k\) and \(X'_k\) are truncated variables,
\[
\text{sign}(X_k - X'_k) = -I(X_k = 0, X'_k > 0) + I(X_k > 0, X'_k = 0) + I(X_k > 0, X'_k > 0) \text{sign}(X_k - X'_k) \\
= -I(X_k = 0) + I(X'_k = 0) + I(X_k > 0, X'_k > 0) \text{sign}(X_k - X'_k).
\]

Since \(\text{sign}(x) = 2I(x > 0) - 1\), we have
\[
\tau_{jk} = \mathbb{E}\{\text{sign}(X_j - X'_j) \\text{sign}(X_k - X'_k)\} \\
= \mathbb{E}\{2I(X_j = 2)I(X'_k = 0) - 2I(X_j = 2)I(X_k = 0) + 2I(X_j = 1, X'_j = 0)I(X'_k = 0) \\
- 2I(X_j = 1, X'_j = 0)I(X_k = 0) + 2I(X_k > X'_k)I(X_j = 2)I(X_k > 0, X'_k > 0) \\
- 2I(X_k > X'_k)I(X'_j = 2)I(X_k > 0, X'_k > 0)\}.
\]
\[+2I(X_k > X'_k)I(X_j = 1, X'_j = 0)I(X_k > 0, X'_k > 0)
- 2I(X_k > X'_k)I(X_j = 0, X'_j = 1)I(X_k > 0, X'_k > 0)\] \\
\[= \mathbb{E}\left\{2I(Z_j > \Delta_{j2})I(Z'_k < \Delta_k) - 2I(Z_j > \Delta_{j2})I(Z_k < \Delta_k) + 2I(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1})I(Z'_k < \Delta_k) - 2I(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1})I(Z_k < \Delta_k) + 2I(Z'_k - Z_k < 0)I(Z_j > \Delta_{j2})I(Z_k > \Delta_k, Z'_k > \Delta_k) - 2I(Z'_k - Z_k < 0)I(Z_j > \Delta_{j2})I(Z_k > \Delta_k, Z'_k > \Delta_k) + 2I(Z'_k - Z_k < 0)I(\Delta_{j1} < Z'_j < \Delta_{j2}, Z_j < \Delta_{j1})I(Z_k > \Delta_k, Z'_k > \Delta_k) - 2I(Z'_k - Z_k < 0)I(\Delta_{j1} < Z'_j < \Delta_{j2}, Z_j < \Delta_{j1})I(Z_k > \Delta_k, Z'_k > \Delta_k)\right\} \\
= 2\left\{\mathbb{P}(Z_j > \Delta_{j2}, Z'_k < \Delta_k) - \mathbb{P}(Z_j > \Delta_{j2}, Z_k < \Delta_k) + \mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z'_k < \Delta_k) - \mathbb{P}(\Delta_{j1} < Z_j < \Delta_{j2}, Z'_j < \Delta_{j1}, Z_k < \Delta_k) + \mathbb{P}(Z'_k - Z_k < 0, Z_j > \Delta_{j2}, Z_k > \Delta_k, Z'_k > \Delta_k) - \mathbb{P}(Z'_k - Z_k < 0, Z_j > \Delta_{j2}, Z_k > \Delta_k, Z'_k > \Delta_k) + \mathbb{P}(Z'_k - Z_k < 0, \Delta_{j1} < Z'_j < \Delta_{j2}, Z_j < \Delta_{j1}, Z_k > \Delta_k, Z'_k > \Delta_k) - \mathbb{P}(Z'_k - Z_k < 0, \Delta_{j1} < Z'_j < \Delta_{j2}, Z_j < \Delta_{j1}, Z_k > \Delta_k, Z'_k > \Delta_k)\right\} \\
= 2\left\{\mathbb{P}(Z'_k < \Delta_k)\mathbb{P}(Z_j > \Delta_{j2}) - \mathbb{P}(Z_k < \Delta_k) - \mathbb{P}(Z_j < \Delta_{j2}) + 2\mathbb{P}(Z_j < \Delta_{j2}, Z_k < \Delta_k) - \mathbb{P}(Z_j < \Delta_{j2})\mathbb{P}(Z'_j < \Delta_{j1}) - \mathbb{P}(Z_j < \Delta_{j2})\mathbb{P}(Z'_k < \Delta_k) + 2\mathbb{P}(Z'_k - Z_k < 0, Z_j < \Delta_{j2}) + 2\mathbb{P}(Z'_k - Z_k < 0, Z_j < \Delta_{j2}, Z_k < \Delta_k) - \mathbb{P}(Z'_k - Z_k < 0)\mathbb{P}(Z_j < \Delta_{j2}, Z_k < \Delta_k) - 2\mathbb{P}(Z'_k - Z_k < 0, Z_j < \Delta_{j2}, Z_k < \Delta_k) + 2\mathbb{P}(Z'_k - Z_k < 0, Z_j < \Delta_{j2}, Z_k < \Delta_k, Z'_k < \Delta_k)\right\} \]
\[ + 2 \mathbb{P}(Z_j' - Z_k < 0, Z_j' < \Delta_{j2}, Z_j < \Delta_{j1}, Z_k < \Delta_k) \]
\[ + 2 \mathbb{P}(Z_k' - Z_k < 0, Z_j' < \Delta_{j2}, Z_j < \Delta_{j1}, Z_k' < \Delta_k) \]
\[ + 2 \mathbb{P}(Z_k' - Z_k < 0, Z_j < \Delta_{j1}, Z_j' < \Delta_{j1}, Z_k' < \Delta_k) \]
\[ - 2 \mathbb{P}(Z_k' - Z_k < 0, Z_j < \Delta_{j1}, Z_j' < \Delta_{j1}, Z_k < \Delta_k, Z_k' < \Delta_k) \]
\[ - 2 \mathbb{P}(Z_k' - Z_k < 0, Z_j < \Delta_{j1}, Z_j' < \Delta_{j1}, Z_k < \Delta_k, Z_k' < \Delta_k) \]
\[ - \mathbb{P}(Z_j < \Delta_{j2}, Z_j' < \Delta_{j1}, Z_k < \Delta_k, Z_k' < \Delta_k) \} \]
\[ = 2 \{ - 2 \Phi_1(\Delta_k)\Phi_1(\Delta_{j2}) - \Phi_1(\Delta_{j2}) + 2 \Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) - \Phi_1(\Delta_{j1})\Phi_1(\Delta_{j2}) \]
\[ + \Phi_2(0, \Delta_{j2}; -\frac{R_{jk}}{\sqrt{2}}) - 2 \Phi_1(\Delta_{j1})\Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) - \Phi_1(\Delta_k)\Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) \]
\[ + 2 \Phi_3(0, \Delta_{j2}, \Delta_k; R_{3e}) - 2 \Phi_3(0, \Delta_{j2}, \Delta_k; R_{3f}) + 2 \Phi_3(\Delta_{j2}, \Delta_{j1}, 0; R_{3d}) \]
\[ + 2 \Phi_4(0, \Delta_{j2}, \Delta_k; R_{4e}) + 2 \Phi_4(0, \Delta_{j2}, \Delta_{j1}, \Delta_k; R_{4d}) + 2 \Phi_4(0, \Delta_{j2}, \Delta_{j1}, \Delta_k; R_{4e}) \]
\[ + 2 \Phi_4(0, \Delta_{j1}, \Delta_{j1}, \Delta_k; R_{4c}) - 2 \Phi_2(\Delta_{j1}, \Delta_k; R_{jk})\Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) \]
\[ - 2 \Phi_5(0, \Delta_{j1}, \Delta_{j1}, \Delta_k; R_{5}) + 2 \Phi_5(0, \Delta_{j2}, \Delta_{j1}, \Delta_k; R_{5}) \} \).

(d) We have

\[ \tau_{jk} = \mathbb{E}\left\{ \text{sign}(X_j - X_j') \text{sign}(X_k - X_k') \right\} \]
\[ = \mathbb{E}\left\{ \{I(X_j = 2) - I(X_j' = 2) + I(X_j = 1, X_j' = 0) - I(X_j = 0, X_j' = 1) \} \right\} \]

+ 2\Phi_2(\Delta_{j2}, \Delta_{k2}; R_{jk})\Phi_2(\Delta_{j1}, \Delta_{k1}; R_{jk}) - 2\Phi_2(\Delta_{j2}, \Delta_{k1}; R_{jk})\Phi_2(\Delta_{j1}, \Delta_{k2}; R_{jk})
\]

**Proof of Proposition 2.** To prove this proposition, we note that Fan et al. (2017) showed that the bivariate normal distribution function \(\Phi_2(\cdot, \cdot; t)\) is strictly increasing with \(t\). Therefore, we have \(\partial \Phi_2(\Delta_j, \Delta_k; t)/\partial t > 0\) for fixed constants \(\Delta_j\) and \(\Delta_k\). Let \(\Phi_d(a_1, \ldots, a_d; \Sigma_d(r))\) be the cumulative distribution function of the \(d\)-dimensional multivariate normal distribution whose covariance matrix equals to

\[
\Sigma_d(r) = \begin{pmatrix}
1 & \sigma_{12}(r) & \sigma_{13}(r) & \cdots & \sigma_{1d}(r) \\
\sigma_{21}(r) & 1 & \sigma_{23}(r) & \cdots & \sigma_{2d}(r) \\
\vdots & \vdots & \ddots & \vdots \\
\sigma_{d1}(r) & \cdots & 1
\end{pmatrix}
\]

Yoon et al. (2020) proved that for any \(a_1, \ldots, a_d\), there exists \(s_{ij}(r) > 0\) for all \(r \in (-1, 1)\) such that

\[
\frac{\partial \Phi_d(a_1, \ldots, a_d; \Sigma_d(r))}{\partial r} = \sum_{i=1}^{d-1} \sum_{j=i+1}^{d} s_{ij}(r) \frac{\partial \sigma_{ij}(r)}{\partial r}.
\]

\(a)\ Let

\[
R_{3g} = \begin{pmatrix} 1 & 0 & \frac{R_{jk}}{\sqrt{2}} \\ 0 & 1 & -\frac{R_{jk}}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & -\frac{R_{jk}}{\sqrt{2}} & 1 \end{pmatrix}
\quad \text{and} \quad
R_{3h} = \begin{pmatrix} 1 & 0 & -\frac{R_{jk}}{\sqrt{2}} \\ 0 & 1 & -\frac{R_{jk}}{\sqrt{2}} \\ -\frac{R_{jk}}{\sqrt{2}} & -\frac{R_{jk}}{\sqrt{2}} & 1 \end{pmatrix}.
\]

We have \(\Phi_3(\Delta_{j2}, \Delta_{j1}, 0; R_{3d}) = \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})\), \(\Phi(\Delta_{j2}) = \Phi_2(\Delta_{j2}, 0; \frac{R_{jk}}{\sqrt{2}}) + \Phi_2(\Delta_{j2}, 0; -\frac{R_{jk}}{\sqrt{2}})\),

and \(\Phi_2(\Delta_{j1}, \Delta_{j2}; 0) = \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3d}) + \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})\).
Therefore,
\[
\frac{\partial F(t; \Delta_{j1}, \Delta_{j2})}{\partial t} = 2\partial \left\{ \Phi_2(\Delta_{j2}, 0; \frac{t}{\sqrt{2}}) - \Phi_2(\Delta_{j2}, 0; -\frac{t}{\sqrt{2}}) + \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3d}) + \Phi_3(\Delta_{j2}, \Delta_{j1}, 0; R_{3d}) \right\} / \partial t
\]
\[
= 2\partial \left[ \Phi_2(\Delta_{j2}, 0; \frac{t}{\sqrt{2}}) - \left\{ \Phi(\Delta_{j2}) - \Phi_2(\Delta_{j2}, 0; \frac{t}{\sqrt{2}}) \right\} \right.
\]
\[
+ \Phi_3(\Delta_{j2}, \Delta_{j1}, 0; R_{3d}) - \left\{ \Phi_2(\Delta_{j1}, \Delta_{j2}, 0) - \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g}) \right\} \right] / \partial t
\]
\[
= 2\partial \left\{ 2\Phi_2(\Delta_{j2}, 0; \frac{t}{\sqrt{2}}) - \Phi(\Delta_{j2}) - \Phi(\Delta_{j1})\Phi(\Delta_{j2}) + 2\Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g}) \right\} / \partial t
\]
\[
= 4 \frac{\partial \Phi_2(\Delta_{j2}, 0; \frac{t}{\sqrt{2}})}{\partial t} + 4 \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial t}.
\]

Then, we only need to prove that \( \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial t} \geq 0 \).

By the chain rule,
\[
\frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial t} = \sum_{i<k} \left\{ \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial \sigma_{ik}(r)} \frac{\partial \sigma_{ik}(r)}{\partial r} \right\}
\]
\[
= \frac{1}{\sqrt{2}} \left\{ \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial \sigma_{13}(r)} - \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial \sigma_{23}(r)} \right\}
\]

where \( \sigma_{ik} \) denotes the \((i, k)\)-th element of \( R_{3g} \).

By Equation (3) in Plackett (1954), we have \( \partial \phi_d/\partial \sigma_{ik} = \partial^2 \phi_d/(\partial x_i \partial x_k) \). Hence,
\[
\frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial t} = \frac{1}{\sqrt{2}} \left\{ \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial \sigma_{13}(r)} - \frac{\partial \Phi_3(\Delta_{j1}, \Delta_{j2}, 0; R_{3g})}{\partial \sigma_{23}(r)} \right\}
\]
\[
= \frac{1}{\sqrt{2}} \left[ \int_{-\infty}^{\Delta_{j1}} \int_{-\infty}^{\Delta_{j2}} \int_{-\infty}^{0} \left\{ \frac{\partial \phi_3(x_1, x_2, x_3; R_{3g})}{\partial \sigma_{13}(r)} - \frac{\partial \phi_3(x_1, x_2, x_3; R_{3g})}{\partial \sigma_{23}(r)} \right\} dx_1 dx_2 dx_3 \right]
\]
\[
= \frac{1}{\sqrt{2}} \left[ \int_{-\infty}^{\Delta_{j1}} \int_{-\infty}^{\Delta_{j2}} \int_{-\infty}^{0} \left\{ \frac{\partial^2 \phi_3(x_1, x_2, x_3; R_{3g})}{\partial x_1 \partial x_3} - \frac{\partial^2 \phi_3(x_1, x_2, x_3; R_{3g})}{\partial x_2 \partial x_3} \right\} dx_1 dx_2 dx_3 \right]
\]
where \( s \) is defined as the ratio of \( x \) to \( \Delta \), we also know that for \( x > 0 \), it also holds that \( \phi(x) = \Phi(x) + x \). Hence \( h(x) \) is an increasing function.
Decomposition of Variation of Mixed Variables by a LMGC Model

\[ \frac{\partial F(t; \Delta_{j1}, \Delta_{j2}, \Delta_k)}{\partial t} = 2 \left[ \frac{\partial \Phi_2(\Delta_{j2}, \Delta_k; t)}{\partial t} \{ 1 - \Phi_1(\Delta_{j1}) \} + \frac{\partial \Phi_1(\Delta_{j2}) \Phi_2(\Delta_{j1}, \Delta_k; t)}{\partial t} \right] + \Phi_1(\Delta_{j2}) \frac{\partial \Phi_2(\Delta_{j1}, \Delta_k; t)}{\partial t} \]

\[ > 0. \]

(c) Let

\[ R_{3i} = \begin{pmatrix} 1 & \frac{R_{jk}}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & 1 & R_{jk} \\ \frac{1}{\sqrt{2}} & R_{jk} & 1 \end{pmatrix}, \quad R_{4j} = \begin{pmatrix} 1 & \frac{R_{jk}}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & 1 & R_{jk} \\ \frac{1}{\sqrt{2}} & 0 & 0 \end{pmatrix}, \quad R_{4g} = \begin{pmatrix} 1 & 0 & 0 & \frac{R_{jk}}{\sqrt{2}} \\ 0 & 1 & R_{jk} & \frac{R_{jk}}{\sqrt{2}} \\ 0 & R_{jk} & 1 & \frac{1}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & \frac{R_{jk}}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 1 \end{pmatrix}. \]

\[ R_{4h} = \begin{pmatrix} 1 & \frac{R_{jk}}{\sqrt{2}} & \frac{1}{\sqrt{2}} & -\frac{R_{jk}}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & 1 & R_{jk} & 0 \\ \frac{1}{\sqrt{2}} & R_{jk} & 1 & 0 \\ -\frac{R_{jk}}{\sqrt{2}} & 0 & 0 & 1 \end{pmatrix}, \quad R_{4i} = \begin{pmatrix} 1 & \frac{R_{jk}}{\sqrt{2}} & \frac{1}{\sqrt{2}} & \frac{R_{jk}}{\sqrt{2}} \\ \frac{R_{jk}}{\sqrt{2}} & 1 & R_{jk} & 0 \\ \frac{1}{\sqrt{2}} & R_{jk} & 1 & 0 \\ \frac{R_{jk}}{\sqrt{2}} & 0 & 0 & 1 \end{pmatrix}. \]

We have

\[ \Phi_3(0, \Delta_{j2}, \Delta_k; R_{3f}) = \Phi_2(\Delta_{j2}, \Delta_k; R_{jk}) - \Phi_3(0, \Delta_{j2}, \Delta_k; R_{3i}). \]

$$> 0.$$

Web Appendix B. Derivation of Algorithm 1

Let $\Theta = (\Sigma_1, \Sigma_2, \Sigma_U)$ and $\hat{R} = \hat{R}_1 + \hat{R}_2$. We have $\ell(\Theta) = (1/2)\text{tr}\{ (\hat{R} - \Sigma_1 - \Sigma_2 - 2\Sigma_U)^T(\hat{R} - \Sigma_1 - \Sigma_2 - 2\Sigma_U) \}$. To start the iterations, we need to obtain an initial estimator $\hat{\Theta}^{(0)} = (\hat{\Sigma}_1^{(0)}, \hat{\Sigma}_2^{(0)}, \hat{\Sigma}_U^{(0)})$. First, we estimate $r_g$ by

$$\hat{r}_g = \text{argmax}_{j \leq \min\{m, r\}} \lambda_j(\hat{R}_g)/\lambda_j(\hat{R}_g),$$

(S4)

where $\lambda_j(\hat{R}_g)$ is the $j$-th largest eigenvalue of $\hat{R}_g$. Let $\hat{V}_g = (\hat{v}_g^1, \ldots, \hat{v}_g^{r_g})$, where $\hat{v}_g^j$ is the eigenvector corresponding to $\lambda_j(\hat{R}_g)$ and $\hat{D}_g = \text{diag}\{\lambda_1(\hat{R}_g), \ldots, \lambda_{r_g}(\hat{R}_g)\}$. Then, we let $\hat{\Sigma}^{(0)}_g = \hat{V}_g \hat{D}_g \hat{V}_g^T$ for $g \in \{1, 2\}$ and $\hat{\Sigma}_U^{(0)} = (1/2)(\hat{R} - \hat{\Sigma}_1^{(0)} - \hat{\Sigma}_2^{(0)})$. Denote the solution of $\Theta$ at the $h$-th iteration as $\hat{\Theta}^{(h)} = (\hat{\Sigma}_1^{(h)}, \hat{\Sigma}_2^{(h)}, \hat{\Sigma}_U^{(h)})$. At the $(h+1)$-th iteration, we first fix $\hat{\Sigma}_2^{(h)}, \hat{\Sigma}_U^{(h)}$ and solve for $\hat{\Sigma}_1^{(h+1)}$. This becomes a spectral regularization problem.
As shown in Mazumder et al. (2010), this problem can be solved by a hard-thresholding Singular Value Decomposition (SVD). In particular, let \( \hat{R} - \hat{\Sigma}_2^{(h)} - 2\hat{\Sigma}_U^{(h)} = U_{\hat{r}_1}^{(h)} D_{\hat{r}_1}^{(h)} V_{\hat{r}_1}^{(h)T} \) be the rank-\( \hat{r}_1 \) SVD. We have \( \hat{\Sigma}_1^{(h+1)} = U_{\hat{r}_1}^{(h)} S_{\hat{r}_1} (D_{\hat{r}_1}^{(h)}) V_{\hat{r}_1}^{(h)T} \), where \( S_{\hat{r}_1} (D_{\hat{r}_1}^{(h)}) = \text{diag}\{ (\lambda_1^{(h)} - \nu_1), \ldots, (\lambda_{\hat{r}_1}^{(h)} - \nu_1) \} \) and \( \lambda_j^{(h)} \) is the \( j \)-th largest singular value of \( D_{\hat{r}_1}^{(h)} \). Then, we check if \( \hat{\Sigma}_1^{(h+1)} \) is positive semidefinite. If not, we project it to the nearest positive definite matrix by solving

\[
\arg\min_{\lambda_{\min}(A) \geq 0} \| \hat{\Sigma}_1^{(h+1)} - A \|_F,
\]

where \( \lambda_{\min}(A) \) is the smallest eigenvalue of \( A \). With a slight abuse of notation, we still denote the solution to (S5) as \( \hat{\Sigma}_1^{(h+1)} \). Then, we fix \( (\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_U^{(h)}) \) and solve for \( \hat{\Sigma}_2^{(h+1)} \), which can be done using the same hard-thresholding SVD. Lastly, we fix \( (\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_2^{(h+1)}) \) and solve for \( \hat{\Sigma}_U^{(h+1)} \). In this step, we use the proximal gradient descent algorithm (Parikh and Boyd, 2014) to solve the corresponding \( L_1 \)-penalization problem. The solution is given by

\[
\hat{\Sigma}_U^{(h+1)} = s(\hat{\Sigma}_U^{(h)} - d \nabla_{\Sigma_U} \ell(\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_2^{(h+1)}, \hat{\Sigma}_U^{(h)}), \nu_3 d),
\]

where \( d \) is the step size of iterations,

\[
\nabla_{\Sigma_U} \ell(\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_2^{(h+1)}, \hat{\Sigma}_U^{(h)}) = 4\hat{\Sigma}_U^{(h)} - 2(\hat{R} - \hat{\Sigma}_1^{(h+1)} - \hat{\Sigma}_2^{(h+1)})
\]

and \( s(x, \pi) \) is the element-wise soft-thresholding operator, whose \((i, j)\)-th element is defined as \( s(x, \pi)_{i,j} = \text{sign}(x_{i,j})(|x_{i,j}| - \pi)_+ \). As for the choice of \( d \), we follow Parikh & Boyd (2014, Section 4.2) to perform a backtracking line search. That is, we iteratively decrease \( d \) until \( \ell(\hat{\Theta}^{(h+1)}) \leq Q_d(\hat{\Theta}^{(h+1)}; \hat{\Theta}^{(h)}) \),

where \( Q_d(\hat{\Theta}^{(h+1)}; \hat{\Theta}^{(h)}) = \ell(\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_2^{(h+1)}, \hat{\Sigma}_U^{(h)}) + (\hat{\Sigma}_U^{(h+1)} - \hat{\Sigma}_U^{(h)}) \nabla_{\Sigma_U} \ell(\hat{\Sigma}_1^{(h+1)}, \hat{\Sigma}_2^{(h+1)}, \hat{\Sigma}_U^{(h)}) + \frac{1}{2d} \| \hat{\Sigma}_U^{(h+1)} - \hat{\Sigma}_U^{(h)} \|_F^2 \). We stop the iterations when the proportion of the maximal changes of \( (\hat{\Sigma}_1, \hat{\Sigma}_2, \hat{\Sigma}_U) \) between two consecutive iterations is less than \( \zeta \), where \( \zeta \in (0, 1) \) is a user-defined stopping threshold, which is set to be 0.1 by us.

Web Appendix C. Numerical Convergence of Algorithm 1

We use Model 1 from Scenario 2 to investigate the numerical convergence of Algorithm 1. We run Algorithm 1 on this model with fixed \( \nu_1, \nu_2, \nu_3 \), and plot values of the objective function
(panel a), $\|\hat{\Sigma}_U - \Sigma_U\|_F$ (panel b), $\|\hat{\Sigma}_g - \Sigma_g\|_F$ (panels c and d), and $\|\hat{\Sigma}_1 + \hat{\Sigma}_2 - \Sigma_1 - \Sigma_2\|_F$ (panel e) along the iterations of Algorithm 1; see Figure S1. In panel (a), we use red dots to represent the values after one full iteration, i.e., after updating $\hat{\Sigma}_1$, $\hat{\Sigma}_2$ and $\hat{\Sigma}_U$. These figures indicate that our algorithm can finally converge.

[Figure 1 about here.]

Web Appendix D. Rank Estimation

We inspect how well our method estimates the true ranks and how sensitive our decomposition method is to the rank estimation. Our method obtains an initial estimator of $r_g$ by letting $\hat{r}_g = \arg\max_{j \leq \min\{n_g, p\}} \lambda_{j-1}(\hat{\mathbf{R}}_g)/\lambda_j(\hat{\mathbf{R}}_g)$, where $\lambda_j(\hat{\mathbf{R}}_g)$ is the $j$-th largest eigenvalue of $\hat{\mathbf{R}}_g$. Such a rank estimator is commonly used in factor analysis literature (Lam and Yao, 2012; Ahn and Horenstein, 2013). We remark that $\hat{r}_g$ is allowed to over-estimate $r_g$ as the nuclear norm penalty in (5) can further shrink the rank estimator; see Algorithm 1. To see how our method estimates the true ranks, we report in Table S1 the percentage of simulation runs that correctly estimated, over-estimated or under-estimated the ranks in the two groups in all numerical studies. It can be seen that our method can mostly correctly estimate the true ranks in Scenarios 1, 3, 4 and 6. In Scenario 2 and 5, it tends to under- or over- estimate the ranks. The reason is because in these two scenarios $\Sigma_g$ takes a smaller proportion of $\mathbf{R}_g$ so that the rank estimation is harder compared with the other settings. However, if we compare the simulation results in these two scenarios with the counterparts in other scenarios; see Figures 1(b) and 2 in the main manuscript, we find that our method’s performance is not sensitive to rank estimation. Even in Scenarios 2 and 5, it still outperforms the competitors.

[Table 1 about here.]
Web Appendix E. Alternative loss function

In our paper, we choose \( \| \hat{R}_1 + \hat{R}_2 - \Sigma_1 - \Sigma_2 - 2\Sigma_U \|_F^2 \) as our loss function. As one reviewer pointed out, an alternative loss function could be the sum-of-norms loss: \( \sum_{g=1}^{2} \| \hat{R}_g - \Sigma_g - \Sigma_U \|_F^2 \). We apply both loss functions to Model 1 of Scenario 1 with 100 simulations and compare their numerical performance on estimating \( \Sigma_g \) and \( \Sigma_U \); see Figure S2. It is seen that our loss function has better estimation error for estimating \( \Sigma_g \) and higher sensitivity for estimating \( \Sigma_U \), even though its specificity is slightly worse. In practice, both loss functions can be used for variation decomposition.

[Figure 2 about here.]

Web Appendix F. The set-up of each scenario in simulation studies

In all cases, we set \( r_1 = \text{rank}(\Sigma_1) = 3 \) and \( r_2 = \text{rank}(\Sigma_2) = 2 \). In the low-dimensional settings, we set \( n_g = 100 \) for \( g \in \{1, 2\} \), \( p = 60 \) and consider the following choices of \( \Sigma_g \) and \( \Sigma_U \).

Scenario 1: We set \( \Sigma_1 = Q_1D_1Q_1^T \), where \( D_1 = \text{diag}(7, 6.5, 6) \) and \( Q_1 \in \mathbb{R}^{p \times r_1} \) is an orthonormal matrix. To generate \( Q_1 \), we start with \( A_1 = (a_1, a_2, a_3) \in \mathbb{R}^{p \times r_1} \), where the first 30 elements of \( a_1 \) range from 0.02 to 0.6 with increments of 0.02 and the next 30 elements of \( a_1 \) range from 0.71 to 1 with increments of 0.01, elements of \( a_2 \) range from -1.16 to 1.2 with increments of 0.04, and elements of \( a_3 \) range from 0.12 to 1.3 with increments of 0.02. We then apply the Gram-Schmidt normalization to \( A_1 \) to obtain \( Q_1 \). We set diagonal elements of \( \Sigma_U \) to be 1 minus the diagonal elements of \( \Sigma_1 \), and its \((i, j)\)-th off-diagonal element as \( \sigma_{u,ij} = \sigma_{u,i}\sigma_{u,j}\rho^{|i-j|} \) if \(|i - j| = 1 \) and \( \sigma_{u,ij} = 0 \) otherwise, where \( \rho = 0.5 \) and \( \sigma_{u,j} \) denotes the \( j \)-th diagonal element of \( \Sigma_U \). We set \( \Sigma_2 = w_2w_2^T \), where \( w_2 = (w_{21}, w_{22}) \) with the (1:4, 31:35, 54:60)-th the elements of \( w_{21} \) being 0.65 and the rest being zeros. Here, we use \( i : j \) to denote a sequence of consecutive integers from \( i \) to \( j \). The \( j \)-th element of \( w_{22} \) is set as...
\[ w_{22,j} = \sqrt{1 - \sigma_{u,j} - w_{21,j}^2} \] for \( 1 \leq j \leq 60 \), where \( w_{22,j} \) denotes the \( j \)-th element of \( w_{22} \). Under this scenario, \( \| \Sigma_U \|_F \approx 44.89\% \| R_1 \|_F \) and \( \| \Sigma_U \|_F \approx 36.82\% \| R_2 \|_F \), meaning the common variation captures 44.89\% and 36.82\% of total variation in these two groups.

**Scenario 2:** We set \( D_1 = \text{diag}(3.5, 3.5, 3.5) \). Using the same \( Q_1 \) as in Scenario 1, we let \( \Sigma_1 = Q_1 D_1 Q_1^T \). We set the diagonal elements of \( \Sigma_U \) to be 1 minus the diagonal elements of \( \Sigma_1 \), and its \((i, j)\)-th off-diagonal element \( \sigma_{u,ij} = \sigma_{u,i} \sigma_{u,j} \rho^{|i-j|} \) if \( |i-j| \leq 2 \) and \( \sigma_{u,ij} = 0 \) otherwise, where \( \rho = 0.5 \). We set \( \Sigma_2 \) the same as in Scenario 1 with the \((1:3, 31:35, 55:60)\)-th elements of \( w_{21} \) chosen as 0.503 and the rest as 0. Under this scenario, \( \| \Sigma_U \|_F \approx 68.41\% \| R_1 \|_F \) and \( \| \Sigma_U \|_F \approx 62.72\% \| R_2 \|_F \).

**Scenario 3:** We set \( \Sigma_1 \) and \( \Sigma_2 \) the same as in Scenario 1 with the \((1:4, 31:35, 54:60)\)-th elements of \( w_{21} \) to be 0.65 and the rest to be 0. We set the diagonal elements of \( \Sigma_U \) to be 1 minus the diagonal elements of \( \Sigma_1 \). The off-diagonal elements of \( \Sigma_U \) are block-wise sparse structure and given in Figure S3(a). In this scenario, \( \| \Sigma_U \|_F \approx 42.09\% \| R_1 \|_F \) and \( \| \Sigma_U \|_F \approx 33.31\% \| R_2 \|_F \).

In the high-dimensional settings, we set \( n_g = 50 \) for \( g \in \{1, 2\} \), \( p = 90 \) and consider the following choices of \( \Sigma_g \) and \( \Sigma_U \).

**Scenario 4:** We set \( \Sigma_1 = Q_1 D_1 Q_1^T \), where \( D_1 = \text{diag}(11, 10.5, 10) \) and \( Q_1 \in \mathbb{R}^{p \times r_1} \) is an orthonormal matrix. To generate \( Q_1 \), we start with \( A_1 = (a_1, a_2, a_3) \), where the first 45 elements of \( a_1 \) range from 0.02 to 0.9 with increments of 0.02 and the rest elements range from 1.01 to 1.45 with increments of 0.01, elements of \( a_2 \) range from -1.76 to 1.8 with increments of 0.04, and elements of \( a_3 \) range from 0.12 to 1.9 with increments of 0.02. We then apply Gram-Schmidt normalization to \( A_1 \) to obtain \( Q_1 \). We set diagonal elements of \( \Sigma_U \) to be 1 minus the diagonal elements of \( \Sigma_1 \), and its \((i, j)\)-th off-diagonal element as \( \sigma_{u,ij} = \sigma_{u,i} \sigma_{u,j} \rho^{|i-j|} \) if \( |i-j| = 1 \) and \( \sigma_{u,ij} = 0 \) otherwise, where \( \rho = 0.5 \). We set \( \Sigma_2 = w_2 w_2^T \), where \( w_2 = (w_{21}, w_{22}) \) with the \((1:8, 46:52, 81:90)\)-th elements of \( w_{21} \) being set as 0.65 and
the rest as 0. The $j$-th element of $\mathbf{w}_{22}$ is set as $w_{22,j} = \sqrt{1 - \sigma_{u,j} - w_{21,j}^2}$. Under this scenario, 
\[ \|\Sigma_U\|_F \approx 36.37\% \|\mathbf{R}_1\|_F \text{ and } \|\Sigma_U\|_F \approx 28.83\% \|\mathbf{R}_2\|_F. \]

**Scenario 5:** This scenario is the same as Scenario 2, except that we set $\mathbf{D}_1 = \text{diag}(4.5, 4.5, 4.5)$ and use the same $\mathbf{Q}_1$ as in Scenario 4. We set $\Sigma_2 = \mathbf{w}_2 \mathbf{w}_2^T$, where $\mathbf{w}_2 = (\mathbf{w}_{21}, \mathbf{w}_{22})$ with the (1:6, 46:51, 82:90)-th elements of $\mathbf{w}_{21}$ set to be 0.459 and the rest to be 0. Under this scenario, 
\[ \|\Sigma_U\|_F \approx 69.39\% \|\mathbf{R}_1\|_F \text{ and } \|\Sigma_U\|_F \approx 62.82\% \|\mathbf{R}_2\|_F. \]

**Scenario 6:** We set $\Sigma_1$ and $\Sigma_2$ the same as in Scenario 4 with the (1:5, 46:50, 83:90)-th elements of $\mathbf{w}_{21}$ to be 0.72 and the rest to be 0. $\Sigma_U$ is block-wise sparse and given in Figure S3(b). In this scenario, 
\[ \|\Sigma_U\|_F \approx 33.2\% \|\mathbf{R}_1\|_F \text{ and } \|\Sigma_U\|_F \approx 25.47\% \|\mathbf{R}_2\|_F. \]

[Figure 3 about here.]

**Web Appendix G. Additional results for real data analysis**

Estimates of non-zero gene-gene and gene-SNP correlations in $\hat{\Sigma}_U$ are given in Tables S2 and S3.
